

# The GLAMwiki toolset project

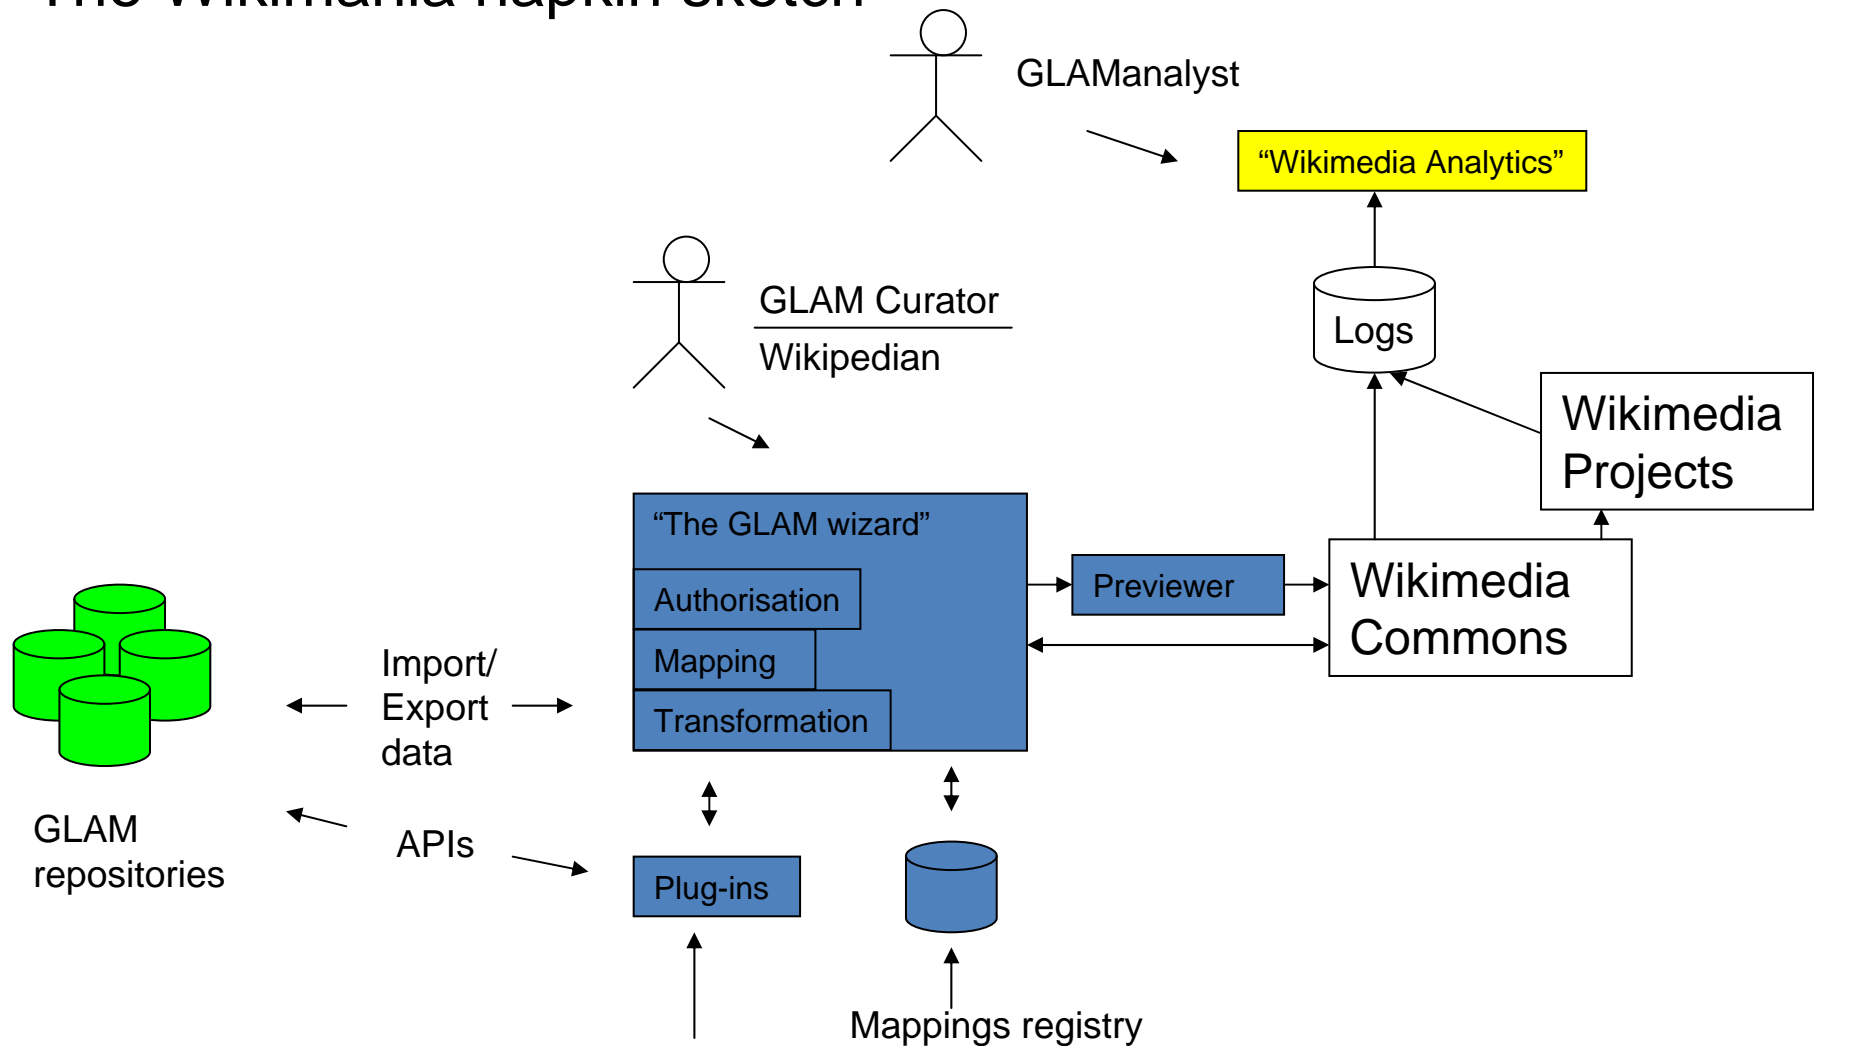

# The GLAMwiki toolset project

- A partnership between Europeana and some European Wikimedia Chapters
  - We have Memorandum of Understanding, not signed in blood yet
- Together we'll build a scalable curator-friendly system for mapping metadata and mass-uploading content from GLAMs to Wikimedia Commons
  - And the reverse process: to download and re-integrate improved content into the original GLAM-repository
- We will provide clear requirements to the Wikimedia Foundation Data Analytics team to build usage statistics solutions that are fit for GLAM-purpose

# The GLAMwiki toolset project

- The project will run for 24 months starting in Q2 2012
- It will comprise developers recruited specifically for the project and Europeana development team staff
- Will be run as an open source project and allow for source code contributions from the developer community
- Software will, if all goes well and goals are met, be integrated into the Wikipedia/Wikimedia Commons infrastructure and be maintained by the Wikimedia Foundation

# The Wikimania napkin sketch

## Europeana plug-in

Media transformation?

Public Domain Calculation?

DPLA plug-in?

...???

= software deliverable

= requirements deliverable

# Or to phrase it differently...

- For a GLAM to upload content to Wikimedia Commons should be a matter of will, not skill
- So it should be as easy as e.g. uploading a set of photos to Flickr.
  - But with better metadata handling!
- And even easier than it is in Flickr to download community annotations for re-integration
- And there should be easy access to stats of use, views and changes, for example:
  - Per GLAM, per collection, per item, per article
  - Per Wikimedia Project and language version

Q1: What would be your definition of succes for this project?

Q2: Which are the major risks you see for this project?

Q3: What would be your most wished for features in this project?
